

# High Throughput Screening in Downstream Processing of Biotechnological Products

Filesize: 8.11 MB

## Reviews

*It is really an remarkable book which i have ever go through. It can be writer in simple terms and not difficult to understand. I am just effortlessly can get a enjoyment of reading a composed pdf.  
(Dr. Lily Wunsch II)*

## HIGH THROUGHPUT SCREENING IN DOWNSTREAM PROCESSING OF BIOTECHNOLOGICAL PRODUCTS

[DOWNLOAD](#)

Cuvillier Verlag Jul 2008, 2008. Taschenbuch. Book Condition: Neu. 208x144x20 mm. Neuware - The aim of this PhD thesis was to establish high throughput screening techniques for the development of downstream processes of biotechnological products. Using the commercially available liquid handling station (LHS) Tecan Freedom Evo(r) 200 techniques to determine crucial parameters for protein solubility measurements, aqueous two phase systems and chromatographic experiments were developed. The solubility screening technique developed within this thesis is based on the evaporation of water and a concurrent increase in buffer and protein concentration. The transition of the target molecule from soluble to the precipitated state during evaporation is followed by monitoring UV-absorption. This technique allows screening for the effect of buffer type, concentration or pH on the kinetic solubility of biomolecules such as proteins. The solubility of different insulin analogues was determined and human insulin was used as a model molecule for which the influence of different salts could be ranked according to the Hofmeister series. For aqueous two phase systems techniques for the determination of the characteristic parameters binodal curves, tie lines, phase volumes and concentrations using the LHS have been established allowing a broad parameter screening. A genetic algorithm has been integrated into the screening procedure. This has resulted in a closed loop in which optimization can be performed completely automated. The separation of plasmid DNA from RNA, a purification task which will gain significance with the establishment of gene therapies, has been optimized in this way. A 10-fold scale up was conducted confirming the good purification results. Using LHS-compatible columns and a suitable fractionation device, which had been developed in previous studies, complex elution experiments and breakthrough curves have been performed on the LHS for the first time. Breakthrough curves have been performed with bovine serum albumin as a standard protein...
