Forgotten Books, United States, 2015. Paperback. Book Condition: New. 229 x 152 mm. Language: English . Brand New Book ***** Print on Demand *****.Excerpt from Furnace Efficiency Combustion and Flue Gases Coal is the great source of energy from which is derived by far the greatest part of the mechanical and electrical power now used in the industrial world. From the beginning of civilization man has made use of this great source of energy apparently with the idea that it is an inexhaustible supply. But unfortunately the coal supply is not unlimited and the time must come when it will be exhausted. What we will do for power when that time arrives is a problem for future generations to solve. The problem for the present, generation to consider is the economical use of our available coal supply, so that the time when the coal will be exhausted may be postponed as long as possible. There is perhaps no class of men so intimately in touch with the problem of the conservation of our coal supply as the operators of steam power plants. A vast amount of coal is consumed every year in the power plants of the world and power plant operators should be able to do much towards the solution of this important problem. It is the chief engineer, the man in responsible charge of the power plant, to whom we must look for economy in the use of fuel. He should be familiar with the latest and best work that has been done on the problem of combustion, and should instruct his firemen and others in his plant how to operate the furnaces at highest economy. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at This book is a reproduction...
